A Note About ACE Field Coils . . .

as Told by Branka Gomez, Supervisor of ACE Field Coil Department

Ace Electric began in 1935 in a rented garage on East 31st Street in Kansas City, Missouri by two gentlemen, Mr. Weiss and Mr. Gordon who imigrated to the United States from Hungary. Their first employee, also an imigrant, Mr. Horvat came from Croatia, formerly Yugoslavia.

So in the beginning Ace was comprised of one man in management (Mr. Weiss), one man for labor (Mr. Horvat), and a one man sales force (Mr. Gordon). Mr. Weiss was responsible for drawing prints of the coils; Mr. Horvat wound, taped and assembled the coils by hand. Mr. Gordon delivered finished product to the customers on his bicycle. Even then they believed in "On Time Delivery".

The company prospered and by 1955 when I started to work there they moved to a larger building at 419 East 31st Street. One room was the office, one was manufacturing and one was for shipping. Manufacturing field coils was still the back bone of the operation but the product line was expanded to include some buy-out items.

Improvements were made in winding the field coils, but the final assembly was still done by riveting or soldering methods. I remember cutting insulation tubing in bundles on a band saw, and lead wires one by one with tin snips. There were eight taping machines in the line and one of them was mine for the next four years.

By the mid 60's the owners decided to sell and retire. The management changed twice before Echlin decided to buy Ace Electric. Echlin saw a great potential in Ace. To improve efficiency, automatic coil winding machines were installed, and I was given the opportunity to supervise the field coil department.

In 1972 it was obvious that we had outgrown this building so we moved to a larger facility at 4840 East 12th Street in Kansas City, Missouri. We had become not only a full line field coil supplier, but also a manufacturer of rotors, stators, and alternators.

When we had outgrown that facility the decision was made to relocate to Columbus, Kansas. In 1977 all of Ace Electric with the exception of the field coil line was moved to Columbus. When the operating expense of two facilities became unprofitable the coil department also moved; so by 1983 Ace was all under one roof in Columbus, Kansas. We brought to Columbus sixty-eight years of experience in making field coils; six of our operators and their families moved from Kansas City to Columbus, Kansas.

To improve work flow and production efficiency we created work centers based on the particular winding machines that coils are wound on. One work center was created for the Globe line to produce coils for Delco 10-MT and Ford. Then the Stellex line was set up to produce 30, 35, 40 and 50-MT type coils. A manual line was established for 8, 20, 25, 27-MT and all other coils that are listed in our catalog.
There are seven basic steps in manufacturing field coils. Winding, insulating a center lead, taping, forming and twisting the wires, trimming and welding. After welding the final step is dipping and baking. Coils are either dipped in wax or varnish depending on their specifications. Coils are then checked for proper wire size, taping thickness, proper forming and jig welded for proper fit in the case.

The main objective in the field coil department is to supply our customer the product he wants, with the highest standard of quality in a timely manner.

About the author:

Branka imigrated to the U. S. in 1954 from Croatia, formerly Yugoslavia. The following year she started to work for ACE Electric. During her first year she worked as a coil finisher, her next four as a taper, six years as a group leader, two years as assistant to the production manager and the last twenty-four as overall superviser of the ACE Field Coil Manufacturing Department. She is very knowledgable and an extremely valuable employee. We are truly fortunate to have her on the Ace team.

Conversion Generator Coils

ACE™

To reverse the rotation of a direct current generator, either the armature current or the field current has to be reversed. The armature current can be reversed by reconnecting the armature coil ends leading to the commutator. Reconnecting armatures is not practical most of the time.

The field current can be reversed in a direct current generator in a fairly simple way. The two leads of the field coils have to be crossed. The field lead which has been connected to the insulated brush should be connected to the ground, or to the ``field'' terminal post, and the grounded lead should be connected to the insulated brush.

Because the splicing and the crossing of the field leads in the generators is not practical most of the time, the following table should be helpful in selecting the proper Ace Field Coils for reverse rotation.

NOTE: Third brush controlled generators cannot be reversed by reversing the field current only. The position of the third brush has to be changed; the third brush has to trail the insulated brush considering the rotation of the armature, otherwise the third brush will not control the generator output.

NOTE: 6 volt coils use 16-20 gauge. 12 volt coils use 20 1/2-22 gauge. 24 volt coils use 22 1/2-26 1/2 gauge.

In order to change generators from one voltage to another, the Field Coils and the voltage regulator have to be changed to the new voltage.
When changing the generator to higher voltage, the armature should have more turns and smaller size wire in proportion to the voltage change.

High Torque Field Coils

Ace high torque field coils are designed to replace the original field coil set when the starter lacks sufficient torque to start the engine in extremely cold weather, or when the engine and the starter are overheated.

When using high torque field coils it is of the utmost importance that:

*The battery is up.

*All contacts and solder joints are perfect.

*Brushes are well seated on clean commutator.

*The starter and vehicle are free from mechanical defects.

Conversion Starter Coils

Field Coils for Effective Utilization of Cores

If you have a shortage of Delco high torque starter cores or armatures, there are ways to use your surpluses of cores or armatures to build starters for high torque applications.

Shallow Slot

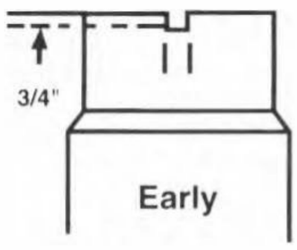

Fig. 1

Use small armature and pole shoe with ACE field coil No. ST-384-C

Deep Slot

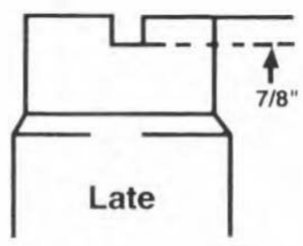

Fig. 2

Use small armature and pole shoe with ACE field coil No. ST-96-ST

Round Hole

Fig. 3

To convert this core to large armature, use compatible pole shoe

The slotted case cores (figures 1 & 2) usually contain the high torque components. If you have an abundant supply of these cores but are short on high torque armatures, you can use the small armature by changing the pole shoe and a conversion high torque field coil.

The case with round hole (figure 3) usually contains the standard (small armature) components. Simply substitute the super-torque field coil to build a high torque starter.

You can also convert the core in figure 3 to the large armature by changing pole shoes and using a conversion coil.

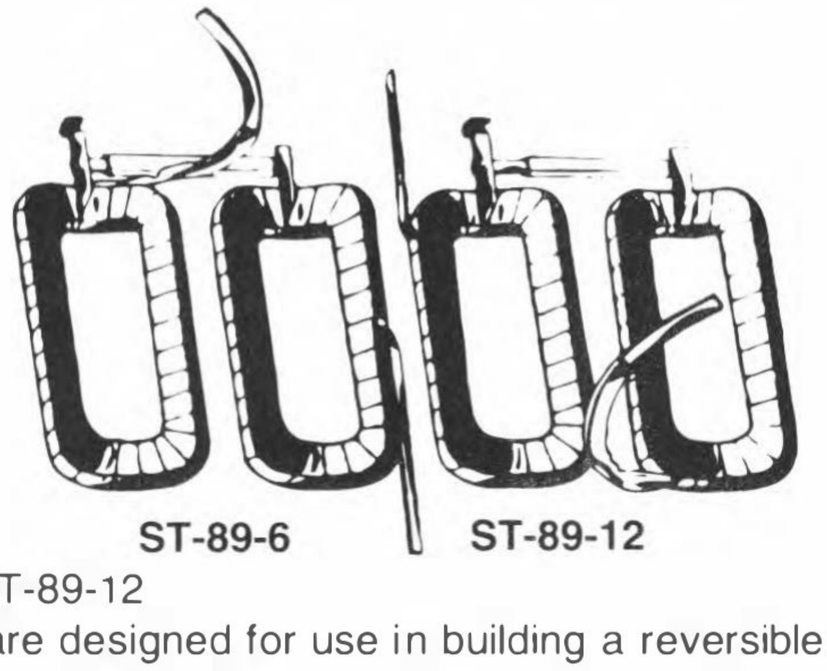
Field Coils for Reversible Motors



ST-89-6 ST-89-12

ST-89-6 and ST-89-12
field coil sets are designed for use in building a reversible motor from a Ford starter. An extra terminal post must be added to the motor. When the battery current is switched from one post to the other, the motor reverses its direction of rotation. ST-89-6 and ST-89-12 are designed for a one wire system; the grounded case completes the circuit. For 6 volt use ST-89-6. For 12 volt use ST-89-12.
